

Green'sche Funktion

$$-u'' = f, \text{ mit } x \in [0, 1], u(0) = 0 = u(1)$$

$$-G''(x, y) = \delta(x - y), \text{ mit } G(0, y) = G(1, y) = 0, \text{ mit } y \in (0, 1)$$

$$\hookrightarrow -G''(x, y) = 0, \text{ für } x \neq y, \text{ da Dirac} = 0 \text{ außer bei } 0$$

$$= G'' = 0$$

$$\hookrightarrow G(x, y) = \begin{cases} Ax + B, & x < y \\ Cx + D, & x > y \end{cases}$$

$$G(0, y) = 0:$$

$$\begin{aligned} A \cdot 0 + B &= 0 \\ B &= 0 \end{aligned}$$

$$G(1, y) = 0:$$

$$\begin{aligned} C + D &= 0 \\ C &= -D \end{aligned}$$

$$\begin{aligned} Cx + D, & \text{ mit } C = -D \\ Cx - C \\ C(x - 1) \end{aligned}$$

$$\hookrightarrow G(x, y) = \begin{cases} Ax, & x < y \\ C(x - 1), & x > y \end{cases}$$

$G(x, y)$ darf keinen Sprung haben:

$$Ay = C(y - 1)$$

$$\int_{y-\epsilon}^{y+\epsilon} -G'' dx = 1$$

$$-G'(y+\epsilon) + G'(y-\epsilon) = 1$$

$$-C + A = 1$$

$$\hookrightarrow \text{I } Ay = C(y - 1)$$

$$\text{II } A = 1 + C$$

$$\begin{aligned} y + Cy &= Cy - C \\ C &= -y \rightarrow A = 1 - y \end{aligned}$$

$$G'(x, y) = \begin{cases} A, & x < y \\ C, & x > y \end{cases}$$

$$\Rightarrow G(x, y) = \begin{cases} (1+y)x \\ y(1-x) \end{cases}$$

$$u(x) = \int_0^x y(1-x)f(y)dy + \int_x^1 (1+y)x f(y)dy$$
